3

has been synthesized from thioacetic acid and zinc chloride by a procedure described in the source. The antiwear and EP (antiseize) properties of I were tested on a four-ball apparatus in synthetic ester oil [unspecified] or mineral (AU spindle) oil, and compared with the properties of tetramethyltetraethioadamantane (II) and the LZ-23k additive [unspecified] tested in the same oils. The tests were conducted at room temperature and at 150C with 2 and 5% solutions of the additives. It was shown that: 1) in contrast to the other additives, the EP properties of I do not drop with temperature (critical load 100—120 kg both at 20 and 150C); 2) the antiwear properties of I exceed those of II; 3) at 20C the antiwear properties of I are poorer, and at 150C better than those of the LZ-23k additive. Tests in synthetic oil as per GOST 981-55 specifications showed that thioadamantane derivatives have higher thermal-oxidative stability than the LZ-23k additive. I exhibits higher thermal-oxidative stability than II. II is more corrosive to copper than I and its sulfur content drops after oxidation. The usual mechanism of action of additives (decomposition and formation of metal sulfides) could not be confirmed for thioadamantanes. Orig. art. has: 3 figures and 1 table.

TITLE: On the stability of conservative systems with infinitely many degrees of freedom

PERIODICAL: Prikladnaya matematika i mekhanika, v. 26, no. 2,
1962, 356 - 358

TEXT: Several simple systems with infinitely many degrees of freedom are considered for the purpose of ascertaining whether the direct method of stability analysis can be applied, with the increment of the total energy as Lyapunov's functional. The concept of positive-definiteness of the function-increment is used. On passing from functions to functionals, the following questions arise: 1) For which metrics of the corresponding functional space is the property of positive definiteness of the increment retained? 2) To what extent does the energy integral furnish knowledge about stability, as compared to that obtained by the direct solution of Cauchy's problem? The second question is answered after considering the stability of a homogeneous free string, stretched between 2 fixed points. ✓
Card 1/2

On the stability of conservative ...

S/040/62/026/002/017/025
D299/D301

This example shows that the energy integral yields only a partial knowledge of the character of system-stability. The first question leads to the following considerations: If the potential energy of the system is a functional of a function of a single variable, then Osgood's theorem ensures positive definiteness with metrics of type ρ_3 , and hence stability for metrics ρ_1 and ρ_3 . If, however, the potential energy depends on functions of more than one variable and on their first derivatives, positive definiteness with a metric of type ρ_3 can no longer be expected. This fact is illustrated by the example of a membrane under a constant transverse load. Finally, the direct method is used for obtaining the stability conditions of a body, within the framework of linear elasticity theory. There are 13 references: 8 Soviet-bloc and 5 non-Soviet-bloc, (Including 1 translation).

TITLE: On the stability of the equilibrium of system with an infinite number of degrees of freedom in the sense of Lyapunov

SOURCE: AN SSSR. Doklady*, v. 157, no. 1, 1964, 63-65

TOPIC TAGS: stability criterion, Lyaopunov stability, equilibrium condition, linear system

ABSTRACT: To demonstrate some of the specific features that are inherent in the concept of stability of equilibrium of systems having an infinite number of degrees of freedom, the character of the stability of a trivial equilibrium position was investigated for three linear elastic systems: a string fastened on the ends, a rectangular membrane fastened along its contour, and an elastic isotropic body in the form of a rectangular parallelepiped rigidly secured over the

Cord 1/3

ACCESSION NR: AP4042016

this theorem, an energy criterion of stability equilibrium is derived for a nonlinear one-dimensional conservative system whose potential energy is a function of the simplest problem of variational calculus, namely: a) the potential energy of the system is positive regular in some expanded strong vicinity of the equilibrium; b) the potential energy of the system is more strongly positive regular in some strong vicinity of equilibrium.

modulator-demodulator unit and a reel type magnetic recorder are connected in series to the output of the recording amplifier unit. For operation with the method of refracted waves, the filter unit has frequency cutoffs of 7--30 hz, and for operation at sea--frequency cutoffs of 20--50 hz. To increase the reliability of the recorded data with operation by the method of regulated directional reception, a switching unit for the channels to be summed, a static correction unit, and a summing unit are connected in series between the magnetic drum recorder and the reproduction amplifier. To increase the reliability when transferring from operation with the method of reflected waves to seismic logging, a frequency selection unit is connected between the multichannel borehole probe and the magnetic drum recorder. To improve the quality of the recorded material, an electron beam unit for introducing static and dynamic corrections is connected between the reproduction amplifier and the drum with photographic paper.

AUTHOR: Slobodkin, L.S.

TITLE: On the Problem of Calculating the Pulverization of Crumbled Peat During Its Drying (K voprosu uchëta izmel'cheniya frezernogo torfa pri yego sushke)

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1959, Nr 4, pp 98-102 (USSR)

ABSTRACT: In order to calculate the degree of peat pulverization during its drying the author experimented with peat drying in a tube-dryer. As results of these experiments he obtained the functional relationships between the Nusselt criterion and the Reynolds criterion $Nu = f(Re)$ and between the number K , being the ratio of the average diameters of lumps of the raw and dried peat, and the hygrometric criterion of Kirpichev Ki' :

$$K = \exp [0.159 (Ki')^{-0.222}]$$

The latter is defined as follows:

$$Ki' = \frac{q' d_{av}}{a' \gamma_0 \bar{u}_0}$$

Card 1/2

where q' is drying intensity in kg/m^2hr ; d_{av} is character-

SOV/170-59-4-14/20

On the Problem of Calculating the Pulverization of Crumbled Peat During Its Drying

istical linear dimension in m ; a' is the coefficient of potential conductivity of substance transfer in m^2/hr ; γ_0 is the density of absolute dry material, and \bar{u}_0 is the initial moisture content of material in kg/kg . These relationships are presented also in graphical form. The comparison of published data of I.P. Garpinich and L.M. Nikitina [Ref 11] with the results obtained by the author from the above relations shows a satisfactory agreement.

There are 3 graphs and 11 Soviet references.

On Structural Mechanical Properties of Crumble Peat in the Drying Process

in slow drying (Figure 1) and in a large laboratory circulation dryer (Figures 2,3) at various temperatures (50 and 100°C), and various moisture content of the crumbled peat. The studies of the forms of water binding in peat, in particular the paper of V.M. Naumovich [Ref 19], showed that peat contains almost wholly adsorption-bound water at a moisture content of up to 0.22 kg/kg. The study of A.V. Lykov [Ref 26] showed that the strained state of large peat particles (above 0.5 mm), caused by the intense drying, leads to their bursting. However, experimental data of A.V. Lykov and G.A. Maksimov [Ref 25] on high-frequency drying of peat showed that the fine fraction was considerably more pulverized than the coarse fraction. The dependence of pulverization degree of crumbled peat on the intensity of mass transfer was shown on

ABSTRACT: The spiral-type culm loaders on many coal combines
and cutting machines operate unsatisfactorily and do
not clean the cuts satisfactorily. Moreover, power
is wasted in milling the culm. The process of trans-
portation of coal fines by horizontal spiral-type
culm loaders is analyzed and a theoretical basis is
given for their design. The process of shifting of
the material within the housing and the effect of the

Card 1/2

Design Factors in Horizontal Spiral-Type Culm Loaders (Cont.)

rate of rotation and size of spiral on the amount of loss of energy
is considered. A number of tolerances, which do not affect the
accuracy of calculation substantially, are given for the purpose of
obtaining simple formulas. These formulas make it possible to de-
termine the necessary rate of revolution of the spiral, the turning
moment, the torque, and the efficiency of a culm loader for a given
output of a given model size. The values depend on: 1) the
structural variables of the loader; and 2) the coefficient of
friction of the culm which varies with the material of which the
spiral and housing are constructed. The calculated relationships
may serve as a starting point for derivation of appropriate formulas
and for designing of other spiral-type culm loaders.

TITLE: Generalized Method for the Derivation of Formulas for the Contact stress Calculation of Helical and Bevel Gears (Obobshchennyi metod vyvoda formul dlya rascheta kosozubchatykh i konicheskikh koles na kontaktnyye napryazheniya)

PERIODICAL: Nauchn. tr. Mosk. gorn. in-t, 1956, Nr 17, pp 53-63

ABSTRACT: Presentation of an elementary derivation of formulas for the stress analysis of helical and bevel gear trains relative to contact shear stresses. The method employs the concept of an equivalent gear which renders possible an extension of the well-known design formulas for spur gears to the case of cylindrical gears with helical teeth and of conical gears. On page 53 the paper contains a wrong dimension for the torque moment, a factor n is omitted under the root in the denominator in formula (12), and a square root appears in formula (27) instead of a cube root.

TITLE:

Control Membrane Valves of Low Delivery

PERIODICAL:

Priborostroyeniye, 1959, Nr 7, pp 14-16 (USSR)

ABSTRACT:

In table 1 the specific capacities C are given for 12 different control membrane valves with different clear opening diameters, which were worked out at the Spetsial'noye konstruktorskoye byuro po avtomatike v neftepererabotke i proizvodstve iskusstvennogo zhidkogo topliva (Special Construction Office for the Automation of Petroleum Refining and the Industry of Artificial Liquid Fuels), and it is stated that diaphragms of low delivery are those in which the specific capacity is lower than 4. Specific capacity is the delivery of an incompressible liquid with the specific weight 1 in cubic meters per hour at a pressure difference of 1 atm before and behind the diaphragm. In recent times, such valves were produced at the Lenneftekip plant, which have a C of from 0.5-1.0. In the above-mentioned construction office valves with the C of 0.1-0.25 were projected, and the problems to be solved in this connection concerning the range of the coefficient C, the clearance, the

Card 1/2

Control Membrane Valves of Low Delivery

SOV/119-59-7-5/18

control of C, etc are discussed. On the basis of figures 1 and 2 the essential components of the valve-types UKS and UKN are discussed and their mode of operation is explained in detail. The construction is characterized by a maximum standardization of the units and single parts of the various types, and three different types are mentioned as examples, which differ solely by the choke system. At present, work is being carried out for the purpose of increasing working temperature, the resistivity to erosion, and working pressure. There are 2 figures, 5 tables, and 1 Soviet reference.

TITLE: The Calculation of Pneumatic Compensating ~~transmitter~~ Transmitter for Pressure Difference

PERIODICAL: Priborostroyeniye, 1959, Nr 10, pp 9 - 11 (USSR)

ABSTRACT: In the introduction, such a transmitter is described with the aid of figure 1. The operation voltage of these transmitters is equilibrated in the working chamber by a system of lever arms. Part One deals with the kinematic calculation of the system. Equation (1) defines the condition of equilibrium of the system. The mechanical transmission ratio equals the ratio of the lever arms (2). The rigidity of the system is calculated according to formula (3). Part One is concluded with the determination of the accuracy of the transmission ratio of the system (Equation (8)). Part Two deals with the errors of such a transmitter, which consist in the systematic nonlinearity of the transmission ratio, the error arising from the frictional force as well as that resulting from temperature changes. The three sources of error are discussed in detail, and the authors give some indications as to their elimination.

Card 1/2

- The Calculation of Pneumatic Compensating ~~Transmitter~~ SOV/119-59-10-4/19
for Pressure Difference

tion or reduction. The Final Part is devoted to a discussion of the equilibration of the system. The forces in the system are partly equilibrated by the weight of the movable elements and partly by deformation of the elastic elements. If the elements are too heavy, or the elastic elements are insufficiently rigid, additional counterweights are used. The results obtained here were checked in the design of such ~~trans-~~mitter in a design office, which has shown good agreement. There is 1 figure.

TITLE: An extremely sensitive flow regulator. Class 47, No. 182991 [announced by the Special Design Office for Automation of Petroleum Processing and Petrochemistry (Spetsial'noye konstruktorskoye byuro po avtomatike v neftepererabotke i neftekhimii)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 12, 1966, 121

TOPIC TAGS: flow regulator, flow control, hydraulic device

ABSTRACT: This Author's Certificate introduces a very sensitive flow regulator consisting of an actuating mechanism and a control unit. Uninterrupted adjustment of the working cycle for the regulating unit plunger during continuous operation of the actuating mechanism rod is achieved by equipping the flow regulator with an adjustment mechanism in the form of a rocker arm sitting on a shaft and connected by a lever to the actuating mechanism rod. The flow control mechanism also contains a section with an annular slot, a regulating screw which moves the section with the slot along the rocker arm, and bushings which move along the annular slot and are rigidly connected to the plunger in the control unit. The relative motion of the

PERIODICAL: "Ukrainskiy Khimicheskiy Zhurnal" (Ukrainian Journal of Chemistry), Vol.23, No.2, March-April, 1957, pp.223-227 (USSR).

ABSTRACT: In an earlier communication it was shown that the interaction between the NO_2 and the NH_2 groups is considerably weakened in the second molecule by introducing the 2,2'-position of the carbomethoxyl groups (1). Further investigations have now been carried out to obtain data for determining the kinetics of the acylation reaction of amino-derivatives in a benzene solution, especially of dicarboisopropoxylic derivatives. The 4-amino-4'-nitro-2,2'-dicarboisopropoxybiphenyl and 4-amino-2,2'-dicarboiso-

✓ The effect of sodium bisulfite on the processes of glycolysis in tissues in vitro. K. V. Slobodkina. *Trudy Chkalov. Med. Inst.* 1955, No. 4, 33-8; *Fiziol. Zhur. Khim., Biol. Khim.* 1957, No. 5151. — A study was made of the effect of NaHSO_3 (I) on the intensity of glycolysis in different tissues of adult rabbits and white rats. After the decapitation of the animal the tissue under investigation was ground and the rate of glycolysis was detd. manometrically by the Warburg method in Ringer-bicarbonate soln. at pH 7.4. The glycolysis was impeded by 25.4% by I in the brain matter during the 1st hr., during the 2nd hr. by 31.46%, and in the cortical part of the kidneys by 18.8 and 23.5%, resp. In the other tissues I appeared to have no effect on glycolysis. R. S. Levine

Title : Tissue Respiration of Various Organs in Intoxication with Sulfur Dioxide.

Orig Pub: Tr. Chkalovsk. med. in-ta, 1956, vyp. 5, 237-246

Abstract: The consumption of O_2 by homogenates of the organs of rats, which were preliminarily subjected to intoxication with SO_2 , acute (under concentration of 1.8-2 mg/lg in the course of 1 hour) or chronic (under concentration of 0.8-0.9 mg/l for 2 hours daily for the duration of 2-3 weeks), was studied. It was found that QO_2 of the brain pulp of rats in both types of intoxication, compared with the control, is lowered on the average by 11% in the

and in the chronic there was obtained even a certain increase of QO_2 , which may be regarded as being connected with the decrease of blood saturation of this organ observed under chronic intoxication. - B. A. Katsnel'son
